### **“IMMEDIACY CONCEPT—SINGLE TO FULL ARCH TREATMENT PLANNING USING THE DIGILOG CONCEPT”**

*8 Hours of CE Lecture, Subject Code 690*

#### **COURSE OVERVIEW**

A paradigm shift has taken place as the Graftless surgical approach has gained credibility.

Reduced treatment time, a single stage surgical reconstructions and immediate loading has resulted in a higher degree of case acceptance.

After extraction of anon restorable tooth, preservation of the soft and hard tissue volume is more predictable than is its reconstruction.

This presentation discusses the surgical as well as the prosthetic fundamental principles for predictable treatment planning for offering patients immediate implant and immediate provisional prosthesis where indicated.

For the terminal dentition patient or the existing fully edentulous patients, certain anatomic structures present barriers for immediate implant placement and immediate loading full arch reconstructions. In the maxilla, the volumetric loss of bone & soft tissues, enlarged maxillary sinuses, and presence of remaining compromised dentition pose unique surgical and restorative treatment challenges. IN the mandible, the position of the mental foramen poses a challenge for reconstruction with a fixed prosthesis.

This presentation will discuss the number as well the distribution of implants for fabrication of an implant supported fixed prosthesis. The use of the Zones of the Maxilla to determine whether axial, tilted or zygo implants may be indicated.

All cases will be treatment planned and executed using the DIGILOG concept; a hybrid of digital as well as the analogue work flow.

The successful fabrication & delivery of fixed implant supported prosthesis is dependent upon a systematic interplay between the surgical and prosthetic treatment planning objectives.
